

Jaime Guevara

Pre-Lab 2

ECE 330L - Spring '19

January 26, 2019

Part A: What is a toolchain?

1. **Define binutils, as defined in the reference.**

The first component of a toolchain.

2. **List the two major items that comprise binutils, as defined in the reference**

- a. *as*, the assembler, that turns assembled code (generated by GCC) to binary.
- b. *ld*, the linker, that links several object code into a library, or an executable.

3. **List the first two pre-built toolchains defined in the reference.**

- a. Free Electrons
- b. Code Sourcery

4. **When talking about toolchains, what are the three machine distinctions (as defined in the reference)?**

- a. The build machine, on which the toolchain is built.
- b. The host machine, on which the toolchain is executed.
- c. The target machine, on which the toolchain generates code.

Part B: Do you know where your toolchain is?

1. **From the command line, issue the `which` command with the native `gcc` command as an argument. What is the path displayed?**

```
/usr/bin/gcc
```

2. **Repeat for the ARM cross platform `arm-none-eabi-gcc`. What is the path displayed?**

```
/usr/local/arm/toolchain/bin/arm-none-eabi-gcc
```

3. **Use the `ls` command to list the other toolchain programs. How many of them are there?**

Assuming that only toolchains are in the `/usr/local/` directory, then using `$ ls /usr/local/ | wc -l` tells us that there are 22 toolchains.

4. Verify that the path for ARM cross platform tools is in the linux environment, using the linux **echo** command.

It's kinda hard to tell as there are multiple entries in PATH for the ARM cross platform directory (at the 2nd and 5th positions).

Result of echo:

```
/usr/local/openocd/0.9.0/bin:/usr/local/arm/toolchain/bin:/home/apps/Xilinx/Vivado/2017.3/bin:/usr/lib64/qt-3.3/bin:/usr/local/arm/toolchain/bin:/usr/local/bin:/usr/bin:/usr/local/sbin:/usr/sbin:/home/apps/MATLAB/R2016a/bin:/home/JaimeGuevara/.local/bin:/home/JaimeGuevara/bin
```

Part C: Toolchain versions

1. What is the version of the native assembler on **0xdeadbeef**?

GNU assembler version 2.27-34.base.el7

2. What is the version of the **0xdeadbeef** ARM cross compiler assembler?

arm-none-eabi-gcc (GNU Tools for ARM Embedded Processors) 4.9.3 20141119 (release) [ARM/embedded-4_9-branch revision 218278]

Part D: Distributions

1. What is the URL for this tarball?

<https://launchpad.net/gcc-arm-embedded/+download>

Part E: Tools studied in the lab

1. What chapter in the course reference covers the assembler command?

Chapter 6

2. What chapter covers the linker command?

Chapter 10

Part F: Interpreting block diagrams for linux commands

1. What complete command is represented by the block diagram for the assembler? (Figure 6-4 in the course reference)

```
$ arm-none-eabi-as prog01.s -o prog01.s.o -a=prog01.lst
```

2. What complete command is represented by the block diagram for the gcc compiler? (Figure 17-1 in the course reference)

```
$ gcc -o hw hw.c
```
